

✓ Project | Build the charity: water Game

Concept

Your Mission

Over 700 million people worldwide lack access to clean water. charity: water is on a mission to change that and they need your help getting the word out.

In this project, you will design, wireframe, and build a working prototype of a web-based game that inspires young people to donate to charity: water. You'll think like a UX designer, a game designer, and a developer, all at once.

This is real work. Put your best foot forward - this belongs in your portfolio!

Step 1: Choose Your Game Idea

Your goal is to decide on a game that would be fun, engaging, and relevant for charity: water's goals. Choose something you'd enjoy working on, and that you would be excited to share in your portfolio later on!

Here are some ideas to get you started (feel free to go with those!)—

- **Water Quest:** A fast-paced, whack-a-mole-style game where players tap charity: water's signature yellow jerry cans to earn points. Include a score counter, feedback messages, milestones, and optional obstacles to make it more engaging.
 - **Water Drop:** In this game, users collect as many falling water drops as possible while avoiding pollutants (bad drops). Users tap to collect drops before they hit the ground. Include a score counter, feedback messages, and penalties for "bad drops" to make it more engaging.
- Don't like these ideas? Brainstorm a game concept, or build on the provided examples.

Step 2: Mock-Up Your Game

Create a visual mock-up of your game using hand-drawing. Your mock-up should show the key features of your game and include [branded logos](#).

For this deliverable, we are looking for **two pages total (No AI for this)**:

- A **Starting Page** that shows how a player begins the game.
- A **Gameplay Page** that shows what the game looks like while it is being played and how it works.

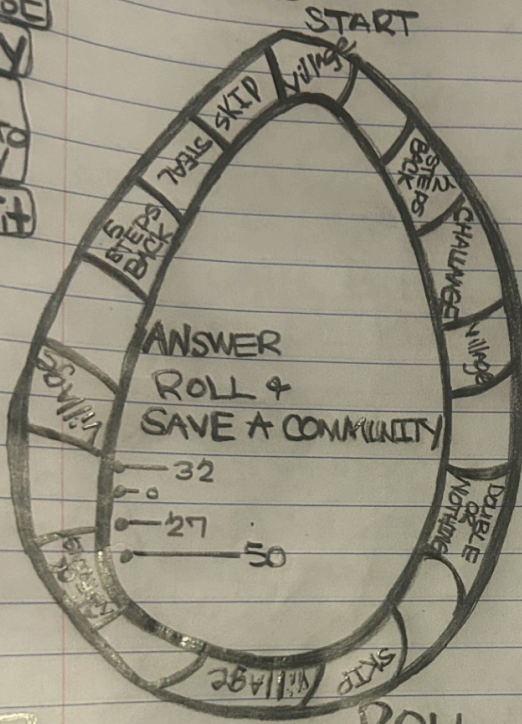

As you design each page, think about what the player sees on screen, such as the title, score, buttons, progress bars, icons, or avatars. Be sure to include all elements, even those users often take for granted, like a 'start' button or a message that tells the player the game has ended.

(Paste your Mock-Up below 🖱️)

Step 3: Plan the Game Logic

Using the template provided below, write up a short explanation of how the game logic works. Ask yourself: What actions does the player take? What gets updated—score, timer, achievements? What feedback does the player get (e.g., animations, visual cues, milestone unlocks)?

Word of advice: Keep it simple, you will have opportunities to iterate and expand your game later, but done is better than perfect, and you have a deadline! Your initial goal is to get started with something that you can do.

As your understanding of the game logic deepens, return to step 2 and adjust your mock-up, removing unnecessary elements and adding new ones.

(Write your own game logic below, following the template format 📌)

Hidden Hero - Water Wellness Warriors - Race to bring clean water to communities globally

1. Game Start:

- After registering and pressing the start game button, all players are placed on the start space on the board. The scoreboard will be set at zero for all players as the first player will answer the first trivia question by clicking on the answer they believe is best or correct. There will also be a 15 second timer for the player to answer the question within that time frame.

2. Player Actions:

- Players will answer trivia questions pertaining to charity: water by choosing one of the four options available. If correct the player will roll two dice and move their avatar accordingly around the game board which will be automatically done. Players could land on special spaces where they could earn bonus points or steal their opponents points. Players will be able to answer a bonus question where they could double their points by answering the question correctly or lose all points going back to zero by answering incorrectly. The game will respond with sound effects and a red light for incorrect answers and a green light for correct answers.

3. Game Logic:

- The game will automatically check all answers and will respond accordingly. This will determine if the player will roll one dice or two dice. Correct answers will roll two dice and their avatar or player will move around the board depending on what they roll on the dice. Doubles will get a player skipped. Getting the wrong answer the player then rolls one dice and moves accordingly but will not earn any points. The game will alter players when they land on a special space where players could move spaces forward or backward, lose points, and steal points. Players could also trigger a challenge where they would have to go against their very next opponent to a trivia question which the game will be also checking for that as well. These actions also have sound effects that will alert the players.

4. Score/Feedback:

- The score is updated every time a person gains or loses points as there will also be a progression bar. Players will also have a chance to earn extra points for their speed. Flashes of color will appear depending on the right or wrong answers as well as when the game is completed. There are sound effects for most things that are done on the board like winning, getting the correct answer, and the avatars or characters moving around the game board. Players will be able to see their character move across the board that will be done automatically after rolling the dice. The leaderboard for the current game will be in the top left hand corner and the leaderboard across all colleges and universities will be at the top left hand corner.

5. Win or Lose Conditions:

- The game ends after a player saves communities by completing a full lap around the board. A victory screen will be displayed with colorful party favors coming from the top of the screen. If there is a tie in the game there will be a last question face off where both players will get one last question and the first to hit the buzzer will have a chance to answer. If the answer is correct they will win if the answer is wrong the other player automatically wins. All scores will always be displayed

when playing the game. After the game ends the players have the option to play again, check out the leaderboards, quit, or click the link for charity: water.

6. Reset/Replay:

- The player can restart and quit the game at any time but they will not earn full points because players have to complete the full game in order to earn points. Players can quit the game by just clicking the X or Quit button that is located at the top left hand corner. Players will also have the option to pause the game as the game will continue even if a player does not answer the trivia questions.

Step 4: Add Branding

Great games for nonprofits carry the brand's identity throughout the experience. Your prototype should feel like it belongs to charity: water from the moment someone sees it. Refine your initial sketch by adding colors, icons, and styles that align with charity: water's brand guidelines. If you're keeping your mock-up minimal, include notes on where the brand's colors, images, links, or icons will be incorporated.

charity: water Brand Guidelines

Primary Color	#FFC700 (Signature Yellow) – used on CTAs, highlights, and icons
Secondary Color	#00A19D (Teal) – used on backgrounds and supporting elements
Typography	Clean, sans-serif. Headlines bold and impactful.
Logo	The charity: water logo and yellow jerry can are iconic assets. Use them!
Tone	Hopeful, energetic, human. Not guilt-driven.
Key Message	"100% of public donations go directly to water projects."

Branding Checklist

- ☒ Yellow (#FFC700) appears somewhere in my game UI
- ☒ The charity: water name or logo is visible on at least one screen
- ☒ A real-world impact message appears (e.g., at a milestone)
- ☒ A link or CTA to charitywater.org is included on the end screen
- ☒ The overall color palette, fonts, and tone feel consistent with the brand

Where specifically have you incorporated charity: water's brand? Describe it below:

Describe your branding choices 📌 Charity: water name is located throughout the game which will be displayed on each screen. The first name is at the very top of the registration screen. Also a link for charity: water's website and donations links are located at the bottom of each screen even while players are playing the game. All colors utilized came from the charity: water's color palette. No other colors were used for this digital game. I also plan on adding charity: water's company logo in the top right or bottom right corners of each screen. A raindrop logo was used on the registration page and it is the shape of the board game.

Step 5: Build Your Prototype

Time to build! Use one of the following tools to turn your wireframe into a real, playable prototype. You don't need a perfect game - you need a working demo.

Tool	Best For	URL
Replit	Writing your own HTML/CSS/JS with AI code help	replit.com
Lovable	Describing your game in plain English and generating code	lovable.dev
Cursor	AI-assisted coding if you prefer a local editor	cursor.com

Build Tips

- Start from your wireframe, not a blank page. Build one screen at a time.
- Use AI to help write code. Describe what you want in plain English: "Write JavaScript that increases a score counter by 10 when I click a div."
- Keep your first version minimal. Get it working, then improve it.
- Test it yourself before submitting. Does it actually run? Can you play it?

Submit Your Prototype

Paste a **public link** to your working prototype below. Test it in incognito mode first to confirm anyone can access it.

Step 6: LevelUp - Show Your Work on LinkedIn (10 pt)

Draft a short LinkedIn post about what you've learned from creating a game prototype for charity: water. You might reflect on what it felt like to design for a mission-driven organization, a challenge you overcame during the design or build process, how thinking about branding and user experience shaped your decisions, or what surprised you about turning an idea into a working prototype.

Consider adding your public game link to your post! Don't forget, this screenshot should be of an actual post on LinkedIn, so yes you actually have to post it to get points. Recruiters and potential employers love seeing posts that showcase your creativity, technical growth, and ability to do real work for real organizations.

(Paste or write your answer below 📌)

I developed a game prototype called Hydro Heroes to help charity: water achieve its goals. I had to think like a coder and a UX designer for this project. In the process of developing an entertaining experience, I wanted to make sure the game communicated the fact that more than 700 million people still do not have access to safe water. One of the most important things I discovered was how important user experience is to sustaining user engagement. The way the game felt was heavily influenced by small things like timers, visual input, and score systems. I also learned how to incorporate branding into a product in a meaningful way, using color, tone, and messaging to align with charity: water's mission. Turning an idea into a working prototype was challenging, but also really rewarding. It showed me how creativity and technology can come together to make an impact.
